## Infor SunSystems Accounting The Complete Financial Management System

### Meet change with confidence

Traditional financial management systems often lock you into rules, structures, and business models that can't evolve to meet changing needs. It doesn't have to be that way. Infor® SunSystems has the agility to work the way you want, empowering you to manage business growth with ease and meet change with confidence.

SunSystems® Accounting does this with "smart transactions", which capture detailed analytical data directly at source, allowing you to see performance up close by breaking transactions down to analyse their precise details. Whether the needs of the business change or processes are being revised, new data can be captured whenever it's needed, and analysis can be performed on that data immediately because analytics are built directly into smart transactions.

Rather than maintain separate sub-ledgers like traditional finance systems, SunSystems uses a unified ledger to hold all financial transactions in a single, integrated transaction set. General ledger, sales, and purchasing are all combined. Fast, easy access to information ensures you'll never be out of balance. And you can easily report across all transactions without requiring reconciliation - all transactions are posted to the same data set simultaneously.

### Support your digital transformation

- Infor OS serves as the underlying technology platform of SunSystems Accounting - ensuring that connected systems work together seamlessly
- With a modern, conversational user experience, SunSystems Accounting is intelligent, intuitive, and delivers great value
- Because SunSystems Accounting is cloud enabled, it can react quickly to ever-evolving industry and market changes

## Satisfy global requirements

SunSystems includes all the functionality needed to embrace international growth - enabling organisations to launch into new markets quickly and efficiently. SunSystems is the only financial management solution with this level of comprehensive functionality built in. Standard out-of-the-box functionality includes:

### Multicompany - independent locales

Multicompany support is standard for most business accounting systems, but SunSystems takes this further with support for configurations of each business as separate locales within one deployment. Each company can have its own base currency, chart of accounts, and business rules to meet local requirements or multiple companies can share configurations within a single dataset for unrivalled speed, efficiency, and ease of reporting.

### Multi-calendar

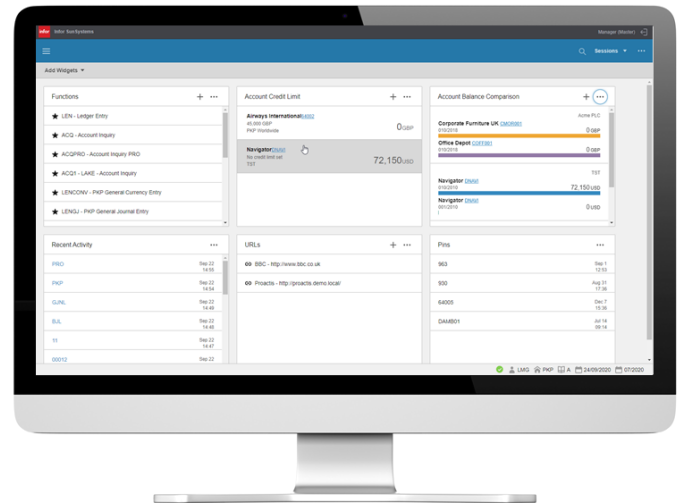

Allocate multiple dates and periods to transactions with ultimate flexibility and complete control to enable reporting across multiple calendars to meet your business requirements.

### Multi-language

SunSystems can run simultaneously in multiple languages, with different users accessing the system in the language of their choice. After selecting a base language, customers can add more than 15 additional languages according to the needs of their users, including English, French, Spanish, German, Italian, Russian, Arabic, Korean, Thai, Polish, Czech, Turkish, Chinese Simplified, Chinese Traditional, Japanese, and Brazilian-Portuguese.

### 4D multicurrency

SunSystems supports four currency dimensions for each transaction: transaction currency, base currency, reporting currency, and fourth currency. This incredible multicurrency power gives customers the ability to address sophisticated requirements such as simultaneously reporting to local and group stakeholders in different currencies, or a charity reporting to its donors in the currency or currencies of their choice.

### Multi-tax (withholding, VAT, GST, QST)

SunSystems tax capabilities can be configured to meet domestic UK and most international taxation requirements. With the addition of MTD for SunSystems, UK users benefit from electronic filing of their VAT returns with HMRC.

### Parallel charts of accounts

Organisations can have various charts of accounts structures for different entities. This supports the requirement of some countries to code financial data to a statutory chart of accounts. Acquired entities may continue to operate a historic coding structure, and different lines of business can utilise other structures that are more appropriate. Multiple charts of accounts can be maintained for each company, making it easy to apply different reporting perspectives to the same financial transactions.

### Parallel books for different accounting treatments

In addition to the actual accounting transactions, another 10 books (transaction sets) are available for each company. These books share the same accounting structure and setup, but hold separate transactions - allowing the capture of budgets and commitment transactions, as well as enabling adjustments to be recorded for alternative treatments (such as local GAAP, US GAAP, IFRS, or tax adjustments).

## Smart transactions for localised reporting

SunSystems allows you to define additional data to be captured and stored on all source transactions, and this can vary for different accounts or types of transaction. For example, for a travel-related expense posting, you may choose to capture the employee code or the destination. You can change data capture requirements and add new dimensions as the business grows and changes. Smart transactions allow you to manage additional data requirements that arise from local accounting practices - even when the requirements change.

## Global access and integrations

SunSystems can be run in the cloud or on-premise. By utilising Infor OS as the underlying technology platform, SunSystems users get a unified modern experience and the ability to create configurable workflows and alerts to help optimise business processes. Integration with additional systems is achieved via Infor ION®, a component of Infor OS that enables SunSystems to connect with both Infor and non-Infor applications, services, and data sources. Infor OS also delivers Infor Document Management (IDM), which allows organisations to store and retrieve in-context information to enhance the user experience.

## Get information you need when you need it

SunSystems' unified ledger provides fast and easy access to smart transactions that deliver detailed contextual information. Whether it's from a general ledger, sales and purchase ledger, or even a user-defined ledger, all financial data is combined in one place without having to wait for batch updates or reconciliations. You'll be able to close your books faster, resulting in lower costs and greater efficiencies.
